## Abstract (Basic): EP 461560 A

A recombinant expression vector capable of expressing, in host cells, the base sequence encoding human leukocyte-derived hepatocyte growth factor (HGF) is new. Also claimed are: (1) a transformant obtd. by transforming mammalian or microorganism cells with the vector; (2) prodn. of recombinant human leukocyte-derived HGF by culturing the transformant of (1) and harvesting the protein from the culture; and (3) a recombinant (esp. single-chain) human leukocyte-derived HGF obtd. as in (2).

Pref. the HGF has an amino acid (AA) sequence corresponding to residues 1(Met) to 723(Ser) of a specified 1st sequence (HLC3) or residues 1(Met) to 723(Ser) of a 2nd sequence also provided (HLC2).

USE/ADVANTAGE - The recombinant HGF is expected to be useful for hepatocyte cultivation, liver regeneration, research into liver function, and the effect of various hormones and drugs hepatocytes, research into the carcinogenesis mechanism of hepatoma. It may also be used to prepare anti-HGF antibodies for use in diagnostics and therapy. Native HGF is secreted only in trace amts. and is difficult to obtain. Use of recombinant techniques will allow mass prodn. of the polypeptide.
